

The Language Eyg

BNF-converter

February 1, 2025

This document was automatically generated by the *BNF-Converter*. It was generated together with the lexer, the parser, and the abstract syntax module, which guarantees that the document matches with the implementation of the language (provided no hand-hacking has taken place).

The lexical structure of Eyg

Literals

Integer literals $\langle Int \rangle$ are nonempty sequences of digits.

String literals $\langle String \rangle$ have the form `"x"`, where *x* is any sequence of any characters except `"` unless preceded by `\`.

NamedReference literals are recognized by the regular expression `@'(_ | $\langle digit \rangle$ | $\langle letter \rangle$) + ':' $\langle digit \rangle$ +`

Tag literals are recognized by the regular expression `$\langle upper \rangle$ (' _ ' | $\langle digit \rangle$ | $\langle letter \rangle$)*`

Id literals are recognized by the regular expression `'!?'(_ | $\langle lower \rangle$)(' _ ' | $\langle digit \rangle$ | $\langle letter \rangle$)*`

Reserved words and symbols

The set of reserved words is the set of terminals appearing in the grammar. Those reserved words that consist of non-letter characters are called symbols, and they are treated in a different way from those that are similar to identifiers. The lexer follows rules familiar from languages like Haskell, C, and Java, including longest match and spacing conventions.

The reserved words used in Eyg are the following:

```
case    handle    let
match   perform
```

The symbols used in Eyg are the following:

```
(      )  =
;      [  ]
,      {  }
|      .  -
->     :   ..
```

Comments

Single-line comments begin with #.

There are no multiple-line comments in the grammar.

The syntactic structure of Eyg

Non-terminals are enclosed between \langle and \rangle . The symbols $::=$ (production), $|$ (union) and ϵ (empty rule) belong to the BNF notation. All other symbols are terminals.

```
 $\langle Program \rangle ::= \langle Exp \rangle$ 

 $\langle Exp \rangle ::= \langle Exp1 \rangle$ 

 $\langle Exp1 \rangle ::= \langle Exp2 \rangle$ 
| let  $\langle MatchPattern \rangle = \langle Exp2 \rangle ; \langle Exp \rangle$ 

 $\langle Exp2 \rangle ::= \langle Exp3 \rangle$ 
|  $[ \langle ListListItem \rangle ]$ 
|  $\{ \langle ListRecordField \rangle \}$ 
|  $\langle Tag \rangle \langle Exp \rangle$ 
|  $| \langle ListParam \rangle | \{ \langle Exp \rangle \}$ 
| perform  $\langle Exp2 \rangle$ 
| handle  $\langle Tag \rangle ( \langle Exp2 \rangle , \langle Exp2 \rangle )$ 
| match  $\langle Exp2 \rangle \{ \text{case } \langle ListMatchItem \rangle \}$ 

 $\langle Exp3 \rangle ::= \langle Exp4 \rangle$ 
|  $\langle Exp3 \rangle ( \langle ListExp2 \rangle )$ 
|  $\langle Exp3 \rangle . \langle Id \rangle$ 
```

$$\begin{aligned}
